

GENERAL CONSIDERATIONS OF OUR FITTINGS

The General Considerations of Lighting Fixtures described below, are applicable to the products – lighting fixtures and components manufactured and marketed by *Climar, Indústria de Iluminação, S.A.*, headquartered at Rua Estrada Real, 50, 3750-866 Borralha, Águeda - Portugal.

Considering several characteristics considered "normal", but which from the end user's point of view, may be considered these behaviors and aspects as an anomaly or defect, Climar clarifies the following:

Item 1 – Luminaires with a Thermoplastic Body

These luminaires may suffer irreparable damages when applied in environments contaminated with chemicals, oils, greases, detergents or acids.

Item 2 – Suspended Luminaires

Considering the manufacturing method and the technology of the materials, slight flexions may occur, mainly in larger dimensions. This behavior is considered normal, and not an anomaly.

Item 3 – Aluminum Profiles - when applied in a continuous line

Due to the manufacturing method and tolerances, in some cases, slight differences in colour tone may occur. This perception may be noticeable when the luminaires are applied in a continuous line.

Item 4 – Luminaires with DALI Drivers

Due to the construction of the DALI Drivers in standby mode, in some cases, the LEDs may present the so called "glowing" effect (a residual brightness).

Item 5 – Acoustic Luminaires and Acoustic Panels

Due to the origin of the recycled materials and the manufacturing process, there may exist slight variations of the fiber mixture and colour tone, as well as surface stains. These characteristics are inherent to this product and are unavoidable.
